CODEBOOK
of the

FAMILIES OF POLES IN THE NETHERLANDS (FPN)
survey

Wave 1
Version 1, April 2016

Kasia Karpinska, Tineke Fokkema, Nina Conkova and Pearl A. Dykstra

Contents

1   Contributors

Prof. dr. Pearl A. Dykstra is the primary investigator of the "Families of Poles in the Netherlands" survey. Dr. Kasia Karpinska was responsible for the scientific and practical coordination of the data collection. The Families in Context team members—Tineke Fokkema, Nina Conkova, Brett Ory, Wouter Quite, Sean de Hoon and Thijs van den Broek— and associated researchers—Aafke Komter and Renske Keizer offered valuable comments on drafts of the questionnaire. Also external experts—Helga de Valk, Marek Okólski, Irena Kotowska and Kinga Wisieńska reviewed the questionnaire, whereas Bartosz Mika checked the translation of the questionnaire into Polish. Sean de Hoon and Stephan van Baarle provided invaluable assistance during the testing phase. Wouter Quite maintains the project's website. Back-up support by Margarita 't Hart during the leave of the coordinator is also gratefully acknowledged. Administrative support was in the hands of the secretaries of the Department of Public Administration and Sociology of the Erasmus University Rotterdam (EUR).

After the data collection was completed, three student assistants provided help with preparing the dataset for release. Justine Staal prepared an overview of the questions and their respective sources. Fay Bänffer provided assistance with the variables' names and labels. Ewelina Marszowska was responsible for the coding of occupations according to the ISCO-88 classification.

2   Overview of the Families of Poles in the Netherlands survey

The Families of Poles in the Netherlands (FPN) survey aims to develop a database which allows examining different aspects of Polish migrant family life, including family formation, generational interdependencies, espoused family obligations and life outcomes. The FPN survey is part of the Generations and Gender Programme—which at present includes a longitudinal survey of 18-79 year olds in 19 countries that aims to improve the understanding of the various factors (including public policy and programme interventions) which affect the relationships between parents and children (generations) and between partners (gender). The Gender and Generations Survey (GGS) has been carried out in the Netherlands and Poland. Linking the FPN to the Dutch and Polish GGS data permits a comparison of the Polish migrant population in the Netherlands, Poles in Poland and Dutch in the Netherlands, and it provides a unique opportunity to unravel the role of migration in shaping family life. The FPN survey was carried out by the Erasmus University Rotterdam and is a part of Pearl Dykstra's ERC

Advanced Investigator project "Families in Context". The survey was executed in cooperation with Statistics Netherlands (Centraal Bureau voor de Statistiek, CBS). The fieldwork was commissioned to GfK Panel Services Benelux, a company experienced in the management of large-scale data collection projects. The GfK project team consisted of Frans Louwen, Dionne Thijssen and Bas Verhagen. The fieldwork was executed between October 2014 and April 2015.

2.1 Background of the survey

The release of formal restrictions on the free movement of Central and Eastern Europeans that started with the end of the Cold War and the eastward enlargement of the European Union in the 2000s have led to new migration flows in Europe. Not surprisingly, the number of surveys carried out among migrants from former communist countries has increased significantly in recent years. These surveys, however, tend to focus on topics such as migration and job history, structural and socio-cultural integration in the host country, bonds with the country of origin or family formation and intermarriage. Insofar exchanges with family members are addressed, they tend to be about remittances to and frequency of contact with "the" family in the country that stayed behind. Information about migrants from Central and Eastern Europe regarding exchanges of money, practical support, emotional support with individual family members, background information on the family of origin, espoused family obligations, and marital and parenthood histories and well-being is scarce. The FPN survey was carried out to fill that void. In absolute terms, Poles are the largest group amongst emigrants from the Central and Eastern European countries which accessed the European Union in 2004. Estimates suggest that between 2004 and 2007, at least one million people emigrated from Poland.[1] Among the top destination countries of Poles in Europe are Great Britain, Germany and the Netherlands.[2] In the Netherlands, the annual number of Polish migrants currently entering the country is greater than the number of traditional migrant groups (Turks, Moroccans, Antilleans and Surinamese) taken together.[3] There are more than 160,000 Poles in the Netherlands according to Statistics Netherlands.

2.2 Design of the survey

A blueprint for the survey is the questionnaire of the Generations and Gender Surveys (GGS). The questionnaire includes a broad array of topics including fertility, partnership, the transition to adulthood, economic activity, care duties and attitudes. The 2015 version of the questionnaire, which was used in the FPN survey, is the most recent one, and it has been approved for future data collection within the GGP. Given the focus on Polish migrants, questions regarding migration history and intentions were added. The FPN data can be matched with the Polish and Dutch GGS, and *Onderzoek Gezinsvorming* data (OG; a longitudinal data on fertility and family formation executed in the Netherlands) to reveal the impact of contextual and policy influences on, among others, family relationships. To study the determinants of family solidarity and migration choices, following changes in respondents' situations over time is necessary. Therefore, the FPN has a panel character – the second wave of the survey will be repeated in three years.

A mixed-mode design was proposed to collect the FPN data: Web survey, Computer Assisted Personal Interview (CAPI) and CATI (Computer Assisted Telephone Interview). This diversity of modes was planned in order to access potential respondents through the manner most convenient for them. The sequential mixed-mode design (starting with Web and introducing CATI and CAPI at later stages of data collection) has been found to increase the response rates among non-Western ethnic minorities in the Netherlands.[4] The Web and CAPI parts were entirely in the hands of GfK. The CATI part of the study was subcontracted to USP Marketing Consultancy in Rotterdam. After pilot testing the questionnaire, the CATI as a method of data collection was, however, discarded. It became apparent that the routings and loops included in the questionnaire are too complex for CATI. Telephone contacts were used to convince sample members to participate in the survey via other available modes.

The survey was executed in Polish and in Dutch, following the recommendation of Tailor-Made Response-enhancing Measures (tmrem).[5] Tmrem includes the use of translated questionnaires, bilingual interviewers and interviewers with a shared ethnic background, and aims to reduce non-response due to language barriers or cultural differences. Dutch- and Polish-speaking interviewers were employed to participate in face-to-face interviews and telephone contacts.

2.3 Access to the data

The data of the FPN survey are freely accessible via the websites of Gender and Generations Programme (http://www.ggp-i.org/) and Data Archiving and Networked Services (DANS, http://www.dans.knaw.nl/). No one has any exclusive right or priority to use the FPN to work on any research question. Research reports using the FPN data must include the following reference to the FPN data:

> Karpinska, K., Dykstra, P.A., & Fokkema, T. (2016). *Families of Poles in the Netherlands (FPN) survey. Wave 1*. DANS. DOI: http://dx.doi.org/10.17026/dans-zep-et7y

Researchers using FPN data must also include the following acknowledgment in their manuscripts:

> "The research presented here is based on Wave 1 data from the Families of Poles in the Netherlands survey (FPN). Financial support for this survey comes from the ERC Advanced Investigator Grant "Families in Context" (ERC, 324211)."

3 Questionnaire

3.1 Content

The questionnaire started with the screening block, to ensure that the right person was participating in the interview. This is especially important, given self-administered web-interviews. Respondents who appeared not eligible for the survey (based on probing questions), were screened out of the survey and their access code became inactive.

The substantive part of the questionnaire consists of the following modules:

A: Background information on respondent

B: Migration history

C: Partnerships

D: Household composition and organisation

E: Parents and parental home

F: Network delineation and support

G: Health and well-being

H: Respondent's activity and income

I: Partner's activity and income

J: Life in the Netherlands

K: Household possessions, income and transfers

L: Value orientations and attitudes

The survey employs a name generator method and in various places in the questionnaire, respondents were asked to name current or previous partners, children, parents, siblings, household members, and persons offering and receiving different types of support. To gather extensive information on the background of each of these people, a number of loops and routings were introduced. Section 7.2 describes the major complexities of the FPN data.

We purposely gave respondents limited opportunities to provide the answer 'don't know'. Open questions were used scarcely; this format was used only in questions about respondents' and their family members' occupation, and in questions on geographical locations of family members. Note that regardless of the mode of data collection, skipping questions was not allowed, resulting in virtually no missing values. The web survey also allowed respondents to fill in the questionnaire at their own pace, to take breaks and return to the designated question at the respondent's convenience.

For the questionnaire and documentation, including show cards used during the CAPI interviews, please refer to the separate files that accompany the dataset.

3.2 Origin of the questions and comparability to other surveys

The vast majority of questions—in particular those regarding exchanges of support and intergenerational solidarity—are based on the GGS 2015 questionnaire and other studies focussing on family ties (e.g. Netherlands Kinship Panel Study (NKPS)). Questions pertaining to migration and integration in the Netherlands were derived from migrant surveys executed recently in the Netherlands or elsewhere, e.g. *Midden- en Oost-Europa* survey (MOE-lander survey), New Immigrant Survey Netherlands (NIS2NL) and The New Immigrant Survey (NIS-06). In addition, the EUR team developed a number of questions. For the list of all questions and their respective sources and possible deviations in the wording of the questions, see Appendix 1.

The list of all questions compares the FPN survey to its blueprint, the GGS 2015 questionnaire. The Polish GGS Wave 1, and recently completed Wave 2, are based on the earlier version of the GGS questionnaire (which was also slightly adapted in the Polish GGS). It is beyond the scope of this Codebook to present all differences between the FPN and Polish GGS.

However, the majority of questions used in both studies are comparable. The major differences between FPN and Polish GGS refer to network delineation—FPN used a name generator and collected extensive information on the background of network members, while the Polish GGS inquired only into relations with support givers and receivers. Also, the FPN survey did not inquire as extensively into fertility and labour market histories as is the case in the Polish GGS.

3.3   Translation of the questionnaire and other materials

The questionnaire for the FPN survey was initially developed in English, as this is the language of the GGS 2015 questionnaire. Subsequently, it was translated into Polish and Dutch for the programming in the Web and CAPI software. The translation was performed by the coordinator of the FPN survey (a native speaker of Polish). The majority of the questions were identical to those used in the Polish version of the GGS questionnaire. The translation of these questions did not require additional work and after careful screening of the content, the Polish version was copied into the FPN questionnaire. New questions were translated by the coordinator and after that back-translated by a native speaker and experienced social scientist to ensure the precision of the translation. The translation into Dutch was done in a similar manner—all questions identical to the OG questionnaire, were copied from this source. The new questions were translated by the coordinator (a fluent Dutch speaker), in consultation with the EUR team members who are native speakers.

Letters to respondents and other correspondence were developed by GfK in Dutch in consultation with the coordinator, who also translated the documents into Polish.

3.4   Programming of the questionnaire

GfK programmed the questionnaire. CAPI was very suitable for data collection as it facilitated complex routings and loops that are part of the questionnaire. Also, it allowed additional instructions to be included and visible for both participants and interviewers. Despite different modes of data collection, the questionnaire that was employed was the same.

To overcome potential language problems, Polish and Dutch versions of the questionnaire were available at each computer that was used in the data collection. Also, an online version of the questionnaire was available in both languages. Both respondents and interviewers could switch between the languages at any point in the interview.

4 Sample

4.1 Sampling procedure

The sampling frame of the FPN survey was population registers (*Basisregistratie Personen*, BRP). Newcomers who intend to remain longer than four months in the Netherlands are required to register in the municipality where they reside. Names and addresses of sample members were drawn by Statistics Netherlands, based on several criteria. The potential respondent:

- was born in Poland and had at least one Polish parent
- was registered in the Dutch population register (BRP) at the time of sampling
- had registered for the first time in the Dutch population register between 1st of January 2004 and the time of sampling (August 2014)
- was between the age of 18 and 49 at the time of the most recent registration

The age range differs from the one in the GGS (i.e. 18-79) and this difference is driven by the population characteristics—Polish migrants in the Netherlands are relatively young (mean age of 34) and including older persons in the sampling frame would not result in relevant data.

The goal of the FPN was to gather information on approximately 1,000 respondents and to achieve a response rate of 50%. Based on these requirements, Statistics Netherlands drew a sample, using simple random sampling (all population members have the same probability of being selected into the sample), ensuring that Polish migrants residing all over the Netherlands were selected. This sample was drawn in two rounds. The first selection took place in August 2014 and it consisted of 2,631 persons (including a margin for not valid addresses). During the fieldwork, it became apparent that the number of addresses that were not correct (i.e. respondent did not live there) was higher than anticipated, and in November 2014 the second batch of addresses was drawn (1,500 addresses). In total 4,131 addresses were selected. Not all addresses drawn in the last round were used in the study. The precise description of the sending out procedure follows in section 5.3.

Once the final sample was created, Statistics Netherlands passed the addresses on to GfK who contacted the sampled Polish migrants. Since the population registers do not include telephone numbers, GfK matched the sample with telephone numbers registered in databases used for marketing research.

4.2 Privacy

The data collection of the FPN survey followed the guidelines for privacy protection that are specified in the European Society for Opinion and Market Research (ESOMAR) Code on Market and Social Research to which the GfK research agency adheres.[6] This privacy code stipulates that the data will be collected using pre-structured answer formats that serve as the basis of the data in the database. The database does not contain any personally identifying information, and respondents are assigned a unique code number that cannot be traced to an existing person. The sample members were informed that their privacy would be fully respected and that the information collected would not be used for any purposes other than scientific research.

As noted earlier, the names and addresses of the sample members were obtained from the population register. During the period of data collection only the GfK fieldwork coordinator and the team members directly involved in the data collection had access to the names and addresses of sample members. After the fieldwork, the names and addresses of all sample members were destroyed. By sharing their email addresses and/or telephone numbers, respondents granted permission to be contacted for the second wave of the data collection. The contact information is used by GfK for panel maintenance—respondents receive birthday and seasonal wishes, and there is the option to inform GfK about changes of a telephone number or e-mail address. Respondents can opt out of the database, if desired. Following privacy guidelines, the EUR team members did not have access to either the sample or to the personal details of sample members. A public release file with anonymized data will be accessible to researchers affiliated with academic and (semi-) government organisations.

5 Fieldwork

5.1 Pilot study

In September 2014, before the fieldwork started, an extensive testing of the questionnaire took place. Both the EUR and GfK project teams tested the programmed version of the questionnaire. The main objective was to ensure the correctness of complex routings. Once satisfactory results were achieved, the pilot with potential respondents was held. During the pilot sessions, wording of the questions and routings were further tested, and interview time was estimated.

---

[6] The ICC/ESOMAR Code on Market and Social Research is available at: https://www.esomar.org/uploads/public/knowledge-and-standards/codes-and-guidelines/ICCESOMAR_Code_English_.pdf

Pilot participants were Polish persons selected by GfK from its panel participant's pool. GfK is a company which also performs market research and the panel pool consists of participants of various nationalities. All pilot participants met the selection criteria of potential participants of the FPN main survey. In total 25 interviews were conducted:

- Six interviews were held in the offices of GfK in Dongen. Four of them participated in face-to-face interviews and two filled in the web questionnaire. All six interviews were held in Dutch.
- Six persons were interviewed in their homes by Polish-speaking interviewers (face-to-face interviews).
- Three persons were interviewed via telephone. One interview was held in Dutch and two in Polish.
- Ten persons were asked to fill in the web survey at home. Half were requested to answer it in Dutch, while the other half in Polish.

The results of the pilot sessions led to final changes in the questionnaire. More instructions for interviewers and clarification points were also added. To ensure that respondents would understand the core of the questions properly, the frequency of support (offered and received) in the network questions were stressed in text in bold. Moreover, the routing for a number of questions about persons visiting the household was not sound and caused misunderstandings. This section was moved to a different block and the routing was adjusted. During the testing phase the duration of the survey was estimated at 45 to 60 minutes for a Web survey and approximately 75 minutes for a face-to-face interview.

During the pilot sessions, it became clear that the complexity of the questionnaire prohibited effective telephone interviewing.

5.2 Interviewers

For successful execution of the CAPI part of the survey, the selection of interviewers was crucial. The Dutch-speaking interviewers were selected from the corps of experienced GfK interviewers. They were provided with written instructions that explained the goal of the survey and the most difficult questions. The GfK field coordinator was available for interviewers' questions.

The Polish-speaking interviewers were selected from a database of people who had previously participated in research executed by GfK, but who had never conducted an interview

before. These interviewers participated in the introductory session in the GfK offices in Dongen, where they received training in interviewing techniques and information about this particular survey. The meeting and the briefing took approximately 3 hours. The training focused on the background of the study and the content of the questionnaire. Interviewers were also instructed on the mixed-mode design and the possibilities it offered for potential respondents. The most complex questions were explained and all procedures and materials (e.g. hard copy of the questionnaire, not-at-home cards, etc.) were discussed. The EUR field coordinator participated in this meeting and was available for further clarifications at any time.

In total, the fieldwork of the FPN survey was executed by 35 interviewers, 9 of which were Polish native speakers. The majority of the interviewers were female and persons who had completed secondary education and on average they were 60 years old. Table 5.2 shows the distribution of the interviews by their mother tongue. The Polish interviewers were higher educated than their Dutch counterparts. They were more likely to be female and to be younger than Dutch interviewers.

Table 5.2. Distribution of interviewer characteristics by mother tongue

	Dutch (N=26) M / %	Polish (N=9) M / %
Age	65.50	47.50
Gender (female)	0.58	0.89
Education		
Higher education	0.15	0.56
Secondary education	0.85	0.44

5.3 Data collection

The fieldwork started in October 2014 and lasted until the end of April 2015. The data collection procedure consisted of the following steps. First, an introductory letter (in Polish and Dutch) together with a pamphlet describing the research (in Polish) were posted to all sample members selected to participate in the survey. The letter contained an invitation to participate in the Web survey, the survey link and a personalized password to the questionnaire. By means of the introductory letter, the respondents were also informed that they could choose between Dutch and Polish when filling in the survey, as well as that the interview would have a duration of 45 to 60 minutes. For the introductory letter and pamphlet, please see the Documentation file.

Two weeks after sending the invitation letter, reminder letters were sent to sample members who had not yet participated in the survey. The reminder letter was similar in content to the introductory letter. In two more weeks, those who had not yet filled in the survey were approached again by means of a reminder card.

Two weeks later another strategy was implemented: those sample members whose telephone number was known were contacted via telephone and asked to participate in the survey. If the telephone contact was not successful or the telephone number was not known, an interviewer was sent to the home address to personally invite the respondent to participate via the web or to make an appointment for a face-to-face interview. Call-me-back-cards with a request to contact the interviewer for an appointment were deposited in the mailboxes of respondents who could not be reached. Interviewers were required to make up to 10 contact attempts to reach the sample members. For an example of a call-me-back card and a contact form to be filled in by the interviewer, see the Documentation file.

5.4 Changes during the fieldwork and response-enhancing procedures

In the process of data collection, it became evident that some of the addresses were not correct. In other words, a number of the selected respondents did not live at the address at which they were registered. The number of invalid addresses was higher than anticipated. To achieve the goal of 1,000 completed interviews, the following steps were taken. The first wave of introductory letters was supplemented by a second wave of invitations to addresses that were initially reserved. Meanwhile, Statistics Netherlands updated the original sample to detect any mutations in the population registers. Letters to sampled participants whose addresses were updated were re-sent. Last but not least, a new sample was drawn to compensate for the relatively high number of invalid addresses. This last batch was selected in December 2014 and included 1,500 addresses, of which only 250 were used in the data collection (the remaining addresses were kept as a back-up but as the fieldwork proceeded, it became clear that those extra addresses were not necessary to achieved the goal of 1000 completed questionnaires). The final sample consisted of 4 batches:

- Sub-sample 1: 2,106 addresses (original sample)
- Sub-sample 2: 525 addresses (the remainder of the original sample)
- Sub-sample 3: 106 addresses (updated addresses from samples 1 and 2)
- Sub-sample 4: 250 addresses (additional addresses)

Close monitoring of the fieldwork resulted in an adaptation of procedures and resources used during the data collection. First, the role of interviewers was adapted. Their efforts were directed at finding potential respondents and convincing them to participate in the survey via the web (Web-mode), rather than conducting an interview.

Moreover, during the fieldwork it became apparent that many sample members started filling in the web questionnaire but failed to complete it. When reached via telephone or at the door by an interviewer, sample members often indicated that they intended to complete the interview and named lack of time as the main reason for the delay. If after a few weeks they did not finish it, they received an additional reminder card with an invitation to complete the interview. When visiting, the interviewers reminded sample members about the possibility of a face-to-face interview, and when desired, scheduled an appointment. Section 6.3 describes the percentages of response per mode of data collection and mode of invitation.

When Dutch interviewers faced language difficulties, an appointment with a Polish-speaking interviewer was scheduled. In general, Polish native speakers were introduced when respondents had severe difficulties communicating in Dutch. When minor problems occurred during an interview (e.g. respondent did not understand a particular question), interviewers switched the language of the questionnaire, and respondents answered questions in Polish directly on the laptop of the interviewer. The interview was then resumed in Dutch.

5.5 Timing of the data collection

Table 5.5 describes the timing of the different samples that were used. The period of the data collection coincided with Christmas time, which is the most important holiday for the Poles and for many a reason to return to Poland. The fieldwork was therefore paused for a period of 3 weeks and resumed in week 2 of 2015.

Table 5.5. Execution of fieldwork 2014-2015

	Sub-sample 1 (2023)*	Sub-sample 2 (502)*	Sub-sample 3 (106)	Sub-sample 4 (250)
Start fieldwork	Week 40	Week 46	Week 49	Week 51
Reminder letter	Week 42	Week 49	Week 51	Week 2
Reminder card	Week 43/44	Week 51	Week 52	Week 3

Telephone contact (if telephone number known)	Week 44-51			
CAPI round	+ Week 2-3	Week 2	Week 2	Week 4
End fieldwork	Week 4	Week 12	Week 12	Week 14
Data release to EUR	Week 17	Week 17	Week 17	Week 17

* These numbers differ from those mentioned earlier. After screening of sub-samples 1 and 2, it became evident some of the sample members changed their place of residence. The updated addresses from those two sub-samples formed a sub-sample 3. These updated addresses were subtracted from the totals in the sub-samples 1 and 2. Consequently, the number of sample members in sub-samples 1 and 2 differs from the number of initially drawn addresses.

5.6 Incentives

Each participant was awarded a so-called VVV gift voucher worth 20 Euro as a token of appreciation. The cards can be redeemed at a majority of retail locations in the Netherlands. Interviewers gave the gift cards to participants after the face-to-face interviews were finished. Respondents who participated in the Web survey received their gift cards in batches. Once a month gift cards accompanied by a thank-you-letter were sent to respondents who had completed the interview during that month.

At the end of the questionnaire, we asked respondents to share contact information that will enable us to contact respondents for the second wave of the data collection. Sharing contact information was voluntary and proximately 80 percent of respondents filled in their contact information. Among respondents who shared their telephone number and/or email address, we raffled off three iPads. The winners were selected by GfK and asked permission to be contacted by the EUR team in order to deliver the prizes personally. Pictures of the delivery were placed on the FPN website (www.familiesincontext.eu/pl).

5.7 Communication with respondents and helpdesk

Information about the project was distributed to respondents via various channels. Respondents received letters and pamphlets informing them about the goals of the study and the necessary steps. Also, a website (www.familiesincontext.eu/pl) and Facebook page were developed to inform respondents about the progress of the data collection.

GfK opened the helpdesk to answer potential respondents' questions. The helpdesk could be reached via a toll-free number (open during working hours) or email. In total, close to

20 respondents contacted the helpdesk. The majority of questions referred to technicalities in the questionnaire or were requests for a new access code after respondents had made mistakes while answering the screening questions.

5.8 Communication with interviewers

Each week interviewers transferred the data from completed CAPI interviews (if any) and information on the outcome of contact attempts. If an interviewer failed to connect via the data portal, the GfK field coordinator contacted the interviewer for clarification. The progress of each interviewer was updated and monitored weekly. If the number of visited addresses deviated from the assignment, the interviewer was contacted. Interviewers could also contact the field coordinator with their questions. During the fieldwork, interviewers were contacted four times via email with updates about the data collection, some interviewing tips and anecdotes about the fieldwork. This communication was intended to motivate interviewers during the assignment.

5.9 Screening of the fieldwork

The work of the interviewers was checked after the completion of the fieldwork. All respondents who participated in face-to-face interviews or were visited by an interviewer, and consequently completed the Web-survey, received a short questionnaire regarding the work of the interviewers. For the questionnaire, see the Documentation file. In total, the request was sent to 513 respondents. 108 respondents returned completed questionnaires (a response rate of 21%). No violations of the interviewer code were noted.

5.10 Observations of interviewers

After finishing the fieldwork, interviewers shared their impressions of this assignment. During the fieldwork, the task of the interviewer shifted to reaching sample members and convincing them to participate in the (Web) survey rather than actually conducting an interview. The willingness to participate in the survey was relatively high; reaching respondents was the challenge. Interviewers observed that sample members were working long hours and were hardly ever at home. Although many potential respondents were not fluent in Dutch, with the help of the materials in Polish, it was possible to direct them to a Polish version of the Web

survey. In the end, many potential respondents preferred the Web survey, as it seemed to fit their demanding schedules. Face-to-face interviewers unanimously reported a pleasant atmosphere during the session. Respondents were generally positive about the study and the questionnaire, although many found a number of the questions to be rather personal, for instance questions regarding the support or satisfaction with relationship.

6   Fieldwork outcomes

In total 1,131 respondents participated in the survey. Table 6.1 gives a short description of the sample. The descriptive statistics of the entire dataset can be found in Appendix 2. The majority of respondents were women. The respondents are on average 33 years old (their ages range between 21 and 58). The majority have the level of education considered necessary to successfully participate in the Dutch labour market (upper secondary or higher). More than 75 percent of the respondents are employed, only 7.3 percent are currently unemployed. A significant share of respondents are not active in the labour market and are either students, homemakers or on leave. The vast majority of respondents have a partner (85 percent) and live also with this partner in the Netherlands.

Table 6.1. FPN sample description

	Mean / %
Male	40.1
Age (range 21-58)	33.0
Education (ISCED)	
Primary	3.2
Lower secondary	21.4
Upper secondary	41.4
Postsecondary, non-tertiary	7.6
Tertiary	26.4
Employment	
Employed	77.4
Unemployed	7.3
Other	15.3
Partnership status	
No partner	14.8
Married	41.6
Registered partnership/legal contract	7.6
Cohabiting, without a legal contract	28.3
LAT	8.0
Partner lives in the Netherlands	90.7

6.1 Response rate

Table 6.2 provides information on the response rates in the first wave of the FPN survey and information on the proportion of valid addresses. The response rate is calculated as the proportion of completed questionnaires to the number of eligible addresses. The address was considered not eligible when the address is not a house; does not exist or is destroyed; is not correct or not traceable. In total 23.1 percent of addresses were not valid.

Of the sample members with valid addresses, 51.4 percent completed the entire survey, approximately 25 percent refused to participate or broke off their CAPI interview (less than 1 percent of all eligible addresses). When a sample members started their Web survey and did not finish it, his or her address was included in the batch of addresses to be contacted by interviews. Consequently, the final status assigned to sample members (i.e., response, refusal, no-contact or other) was based on the result of interviewer efforts. The fact that sample members had started the Web survey was not recorded. The no-contact rate of the FPN study (i.e., contact had been attempted, but the total number of required contacts had not been reached before the termination of the fieldwork) was 20 percent. Another 3.6 percent of sample members were not able to participate in the survey due to various reasons.

Table 6.2. Proportion of valid addresses and overall response rate FPN survey

	Counts	Overall response rate
Bruto sample	**2881**	**100%**

No-contact	445	20.2%
Other	79	3.6%

6.2 Response rate compared to other migrant studies

The achieved response rate is among the highest response rates for studies of Polish migrants in the Netherlands using population registers (i.e. *Gemeente Basis Administratie* (GBA), a predecessor of BRP) as a sampling frame. The only survey in the Netherlands that stands in front of FPN's response rate is the 'Socio-Cultural Integration Processes among new immigrants in Europe' (SCIP) survey with a response rate of 53 percent (based on eligible

addresses). The data collection for the SCIP survey was based exclusively on face-to-face interviews. Its first wave was executed in 2010 and included, among others, information on recent Polish migrants, aged 18-60. Migrants were interviewed within one and a half year after their registration in population registers.[7] While the FPN used a simple random sampling (all population members have the same probability of being selected into the sample), the SCIP survey used a stratified sampling—sample members lived in municipalities with at least 25 registered migrants. A 10 euro gift voucher was offered as an incentive.

NIS2NL (New Immigrant Survey Netherlands), which was a refreshment sample of the SCIP survey, reported a significantly lower response rate of 27 percent. Again, this response rate is calculated as a ratio of all completed interviews over the number of eligible addresses. The survey was executed in 2013 and used only CAWI and paper and pencil modes of data collection. Analogous to earlier studies, a gift voucher worth 10 Euro was offered as a token of appreciation.

The SING (*Survey Integratie Nieuwe Groepen*) survey, is another study executed among Polish migrants in the Netherlands that used the population registers as a sampling frame. This survey was executed in 2009 and parallel to SCIP, applied stratified sampling— first a municipality was selected and in the second stage, a sample members within this municipality. The respondents were 15 years old or older. The response rate among Polish migrants in this survey was 42 percent of eligible addresses.[8] This survey reported their findings for both long term and recent migrants. Data were collected via face-to-face interviews, with an incentive of 10 Euro. As was the case for the FPN, the interviewers were obliged to make up to 10 contact attempts.

6.3   Web & CAPI

The FPN data were collected using a mixed-mode design. The original design assumed the following distribution of answers between three modes: 50 percent Web, 40 percent CAPI and 10 percent CATI. This outcome was not reached as the CATI mode was discarded after the pilot phase and consequently, the role of the interviewers was amended. Ultimately, the majority of people used the Web mode and about one in three made use of CAPI. Table 6.3 shows the distribution of the completed questionnaires in each mode by the mode of invitation.

Table 6.3. Distribution of completed questionnaires by mode of collection and invitation

| | Mode of invitation | | | | | |
| | Written invitation | | Interviewers | | Total | |
	Counts	%	Counts	%	Counts	%
Mode of collection						
Web	514	59%	350	41%	864	76%
CATI	0	0%	0	0%	0	0%
CAPI	0	0%	267	100%	267	24%
Total	514	45%	617	55%	1131	100%

55 percent of all completed interviews (regardless of the mode of data collection) can be allotted to the efforts of the interviewers, either through conducting a face-to-face interview or persuading sample members to participate in the Web version of the survey (at the door or by telephone). The remaining 45 percent of all completed interviews were completed by sample members who responded to a letter inviting them to participate in the study without further intervention on the part of either interviewers or telephone team. Looking at the distribution of completed interviews by the mode of data collection, we observe that 59 percent of all completed Web interviews were filled in by respondents who responded to the written invitation. The remaining 41 percent of Web interviews came about through the intervention of the interviewers. Needless to say, all CAPI response came about by the effort of interviewers.

6.4 Average duration

On average, it took respondents 66 minutes to fill in the Web survey, slightly higher than the estimated 45-60 minutes. The software in the CAPI form did not allow measuring the duration of an interview and this information is missing in the dataset. To approximate the duration of the CAPI interviews, the questionnaire designed to evaluate the work of the interviewers included a question on the approximate interview time. Based on the answers, the average time of the interview was estimated at 65 minutes, 10 minutes less than our original initial expectation for a face-to-face interview.

6.5 Mode effects

Mixed-mode designs are advocated because they help ensure good coverage and high response rates.[9] The mixed-mode design in the FPN survey (Web and CAPI) was employed in order to ensure flexibility and thus participation from those working long hours. Web interviewing is a powerful tool in that regard, as it gives the respondents the opportunity to fill in the questionnaire at their convenience. Although very useful and cost-effective, mixed mode has one main disadvantage—it may introduce a mode effect. Some categories of respondents are more likely to respond to a particular mode of data collection (e.g. due to convenience); some questions are more appropriate in a certain mode than in another, which potentially leads to different answers (mode property); respondents might be affected by the properties of the mode while others are not (e.g. participants of Web survey might be less likely to offer socially desirable answers than those who participate in CAPI mode).[10]

To assess whether there is a mode effect, we looked into the background of people whose data were collected via CAPI rather than via another mode. We created a variable designating the mode of data collection (1=CAPI) and regressed it on a number of background characteristics: gender (1=male); age (defined as three categories: <25, 25-35 and >35); educational level (primary, lower secondary, upper secondary and tertiary); employment status (employed, unemployed and other); partner status (single, married, registered partnership, cohabiting without legal contract, LAT); church attendance (1=no attendance); self-rated happiness (1=(very)happy)); satisfaction with life in the Netherlands (answers ranging from 1 to 10), loneliness (answers ranging from 0 to 6); and self-rated health status (1= good health). Table 6.4 shows the results.

Table 6.4. Logistic regression of choice of CAPI mode of data collection (N=1,129)

	Odds Ratio	z-statistics
Male	1.20	1.16
Age category (*ref. <25*)		
25-35	1.15	0.60
>35	1.55	1.77

***$p<0.001$, ** $p<0.01$

Results show that background characteristics such as gender and age were not associated with the choice of the mode of data collection. Higher educated respondents were more likely to participate in the Web-survey rather than in the CAPI survey as compared to respondents with secondary education. This may be related to the fact that higher educated are more familiar with IT-technology and perhaps have an easier access to Internet than respondents with secondary education. These results show that there might be some selection into a mode of data collection based on educational gradient. No difference between higher educated and respondents with lower educational level was found. Unemployed respondents were more likely to participate in the CAPI interview. Apart from these socio-demographic differentials, we also found that people who considered themselves happier were more likely to participate in the CAPI interview. The higher happiness scores might be attributable to social desirability (aiming to present oneself in a composed way to the interviewer). Conversely, the lower happiness scores might arise from the opportunity provided in a Web survey to disclose feelings more openly. It is important to acknowledge that the answers to items measuring sensitive questions might differ between modes of data collection. Note, however, that the answer patterns for loneliness, self-rated health and satisfaction with life in the Netherlands

were not significantly associated with the choice of mode. Although the mode effects seem moderate, when analysing sensitive topics, users of FPN data are advised to include the mode of data collection in the explanatory analysis or to refer to more complex techniques such as propensity score matching and structural equation modelling, to reduce potential biases.

6.6   Language of the data collection

The language of the data collection was not automatically registered by the used software, neither in Web nor in CAPI mode. Although technically possible, it would have obstructed switching the language during the interview. To assess in which language the data were collected, we examined the language respondents used to answer open questions (e.g., occupation). If the majority of open questions were answered in Polish, the interview was marked as conducted in Polish too. If the number of open questions was distributed more or less equally between both languages, the language of the last open question determined the overall assignment into a language category. If answers in open questions were missing, self-rated proficiency of Dutch was used as a proxy of the interview language. This strategy was applied in less than 10 cases. Almost 80 percent of the questionnaires were filled in in Polish.

6.7   Representativeness of the sample

A high degree of representativeness is a prerequisite for generalizing the findings to the target population. In order to make meaningful inferences, the characteristics of the sample should closely reflect the characteristics of the research population. Unequal probabilities to participate in the study and selective non-response may lead to biased results. The FPN survey used simple random sampling—each registered Polish migrant had an equal chance of being selected for the study. Non-response should however be taken into account.

Using the population registers and applying chi-square statistics, Statistics Netherlands compared the realized sample to the population of Polish migrants in the age category 18-59. Both groups were compared with respect to the following characteristics: age, sex, household composition, personal income, socioeconomic status, nationality, region of the country, degree of urbanization, and length of stay in the Netherlands (e.g. time since official registration). Below we present the distribution of the main characteristics of the research population and the realized sample, and the ratio of the two.

The distribution by sex (Table 6.5) differs from the population proportions. Men in our sample are under-represented by around 8 percentage points. This is however, not unusual, as men are typically under-represented in surveys.[11]

Table 6.5. Distribution by sex for the population and the realized sample

	Realized sample	Population	RS/population
Gender	%	%	%
Men	40.1	48.9	0.8
Women	59.9	51.1	1.2

Table 6.6 depicts the age distribution of the realized sample in comparison to the population of Polish migrants registered in the Netherlands, for males and females. The sampling design assumed the age range of 18 to 59. The table shows that the age patterns of non-response differ by sex. Men are under-represented in all age categories but one—those in the 26-30 age category. Women are over-represented in all age categories.

Table 6.6. Distribution by age for the population and the realized sample, for men and women

	Man			Woman		
	Realized sample	Population	RS/ population	Realized sample	Population	RS/ population
Age	%	%	%	%	%	%
18-25	11.4	14.1	0.8	24.6	21.4	1.1
26-30	15.0	15.2	1.0	19.0	14.2	1.3
>31	13.7	19.6	0.7	16.3	15.5	1.1

Table 6.7 shows the representativeness in terms of household composition. For men, we observe that the married (living in a household with and without children) are over-represented. Similar patterns hold for women, who, in addition to married status, are also over-represented in cohabitating-with-children status. Single parents are over-represented in our sample, and this overrepresentation is more pronounced for men than for women. One-person-households are under-represented, for both males and females, which is often found in surveys.[12]

Table 6.7. Distribution by household composition for the population and the realized sample, for men and women

Household composition	Men			Women		
	Realized sample	Population	RS/popu-lation	Realized sample	Population	RS/popu-lation
	%	%	%	%	%	%
Living alone	11.9	22.8	0.5	12.4	14.4	0.9
Cohabiting, no children	8.9	9.0	1.0	10.7	10.4	1.0
Married, no children	4.4	3.5	1.3	7.0	4.8	1.5
Cohabiting, with children	4.5	4.6	1.0	9.5	6.5	1.5
Married, with children	9.4	8.3	1.1	15.7	10.8	1.5
Single parent	1.0	0.6	1.7	4.6	4.2	1.1

In our analysis we also looked at the respondents' region of residence and its level of urbanization (Tables 6.8 and 6.9 respectively). The sample design of the FPN survey was based on random sampling design—each registered Polish migrant fulfilling the eligibility criteria had the same likelihood of being selected into the sample. This design resulted in a wide geographic distribution of respondents. When looking at the distribution by region, it becomes clear that there is an under-representation of respondents in the northern regions of the Netherlands. The remaining regions are covered in accordance with the population proportions. Those numbers do not include the biggest cities in the Netherlands: Amsterdam, The Hague and Rotterdam. Respondents from The Hague are over-represented while those from Amsterdam and Rotterdam are under-represented. Yet, when looking at the level of urbanization of the region of residence, there is an overrepresentation of respondents in highly urban places, while respondents living in highly rural locations are under-represented.

Table 6.8. Distribution by region of residence in the Netherlands, for the population and the realized sample

Region	Realized sample	Population	RS/population
	%	%	%
North	2.7	3.0	0.9
East	11.9	12.1	1.0
West, excluding big cities	37.3	36.8	1.0
South	30.0	28.4	1.0
Big cities			
Amsterdam	3.1	4.9	0.6
The Hague	9.2	8.4	1.1
Rotterdam	5.8	6.5	0.9

Table 6.9. Distribution by level of urbanization of the region of residence for the population and the realized sample

	Realized sample	Population	RS/population
Urbanization	%	%	%
(1) Highly urban	30.2	28.6	1.1
(2)	22.7	21.6	1.1
(3)	19.2	22.1	0.9
(4)	19.9	18.9	1.1
(5) Highly rural	8.0	8.9	0.9

Finally, the realized sample was compared with the research population with respect to the length of stay in the Netherlands (e.g. the time since the official registration, Table 6.10). The numbers show that longer-term residents are over-represented in our survey, and more strongly so for women than for men.

Table 6.10. Distribution by length of stay in the Netherlands for the population and the realized sample, for men and women

	Men			Women		
	Realized sample	Population	RS/population[a]	Realized sample	Population	RS/population[a]
Length of stay	%	%	%	%	%	%
<= 7 months	3.6	6.3	0.6	5.0	5.1	1.0
7-14 months	3.2	5.6	0.6	4.1	5.2	0.8
14-22 months	3.4	5.0	0.7	5.5	4.7	1.2
22-30 months	5.5	4.9	1.1	6.6	4.8	1.4
30-38 months	4.2	4.5	0.9	5.4	4.5	1.2
38-49 months	4.0	4.8	0.8	6.8	5.1	1.3
49-62 months	5.5	4.7	1.2	6.3	5.2	1.2
62-76 months	3.3	4.5	0.7	5.2	5.2	1.0
76-95 months	4.3	4.5	1.0	6.3	5.2	1.2
>=95 months	3.2	4.1	0.8	7.7	6.0	1.3

6.8   Weights

After the data were compared to the population statistics, a weight variable was constructed (WEIGHT). Statistics Netherlands compared the sample to the population with respect to the following auxiliary variables: sex, age (3 categories, two youngest categories were combined), time since registration in population registers (10 categories), household type (6 categories), personal income (8 categories), socioeconomic status (6 categories), nationality (2 categories), region of residence (7 categories), and urbanization level (5 categories).

The selection of auxiliary variables and combining them into a weighting model was done in two steps. First, response probabilities were modeled using the set of the auxiliary variables. In this model only significant auxiliary variables were included. This model then was used to weight the response data. In the second step, the earlier-non-significant auxiliary variables were again used in the weighting model, this time using previously weighted data. The procedure was repeated until the marginal distributions of each auxiliary variable were equal to those in the population. The resulting weight factor is a so-called analytical weight, meaning that the total sample size is unchanged (i.e. not inflated to population size).

7   Documentation of the data sample

7.1   Variable names

The variable names were coded according to the following key:

- First letter (a) denotes the first wave of FPN data.
- Second letter (a thru l) identifies the block where the question was placed in the questionnaire (for details see section 3.1).
- The number is the number of the question in the questionnaire. Due to the large number of network questions, underscores and a number were used to identify different persons in the questionnaire.

Below we describe the working of this key:

Example of a variable name: ac325_01

a –   First wave of the data collection

c –   Block C (Partnerships)

325–   Question 3.25 (Names of previous partners)

_01–   First (Name of the first previous partner)

All variable labels are created following the original questions and are self-explanatory in their nature.

7.2 Technicalities and complex routings

7.2.1 Geographical location of network members

Respondents reported on the geographic location of each network member (e.g. country and place of residence). In the questionnaire, only the most common European countries were listed in a drop down menu, which was followed by an open question allowing other answers to be included. The first two entries in the list were 'Poland' and 'The Netherlands' (as we anticipated that those are the most common answers), followed by names of other countries. These are included in alphabetical order, according to their English names. For network members living in Poland, information on the province and city of residence was also collected. This information was not recoded and the names of cities are presented in alphabetical order, according to their Polish names. For information on geographic location of respondents in the Netherlands, see section 7.3.

7.2.2 Questions about parents

Block E (Parents and parental home) included many questions on the circumstances of parents. To limit repetitions and lower respondent's strain, a number of routings were introduced. When respondents indicated that both parents were alive and lived together, questions on the geographical location and living situation were asked for both parents simultaneously in one question. However, if respondent indicated that both parents were alive but not living together, these questions were asked separately for mother and father. If only one parent was alive, respondents were directed to questions pertaining to the living parent.

7.2.3 Network delineation

A large part of the FPN questionnaire is devoted to support networks of migrants (Block F). Similarly to the GGS 2015 questionnaire (blueprint of FPN), the FPN questionnaire employed a name generator asking for the receivers and providers of different forms of support, i.e. emotional support, care for children, practical help in the household and financial support. Unlike the GGS 2015, which capped the number of alters at five, the FPN survey did not impose such limitation. Moreover, we intended to gather information not only on the provider and recipients of the support (as done in GGS 2015), but also on their background characteristics,

including place of residence, to allow for a systematic and more careful examination of support behaviour within and across national borders.

To make the name generation suitable for self-administrated Web survey and given the limits of programming loops, the procedure of generating support network members had to be amended. Instead of asking the respondent to list all people with whom he/she exchanged support, we offered a drop-down menu including all names that were mentioned by the respondent in the previous blocks (i.e. names of partners, children and parents). Thus, whenever a support question was asked, the respondent was first asked whether any person from this list provided or received the respective type of support. The respondent could mark all appropriate names. Again, there was no limit on the number of persons that could be selected; the number could range from zero to all previously named people. Once the selection of previously named people who provided or received support was completed, the respondent was asked whether there are other people who have provided to or received from him/her the respective type of support. Upon a confirmatory answer, the respondent was directed to an open question, where he/ she could add up to five new names. This procedure was repeated for all support questions in block F. In each subsequent question following the opening question of block F, the names that appeared in the drop-down list were updated with the previously added new names, so the new network members could be selected in the following support question (rather than being named again). After all support questions were completed, the loop with background questions was activated only for new names (e.g., not the names that were mentioned in the earlier parts of the questionnaire).

Although this approach provided detailed information on the network of Polish migrants in the Netherlands, it also introduced a potential bias in the study. By viewing the list of previously named alters, respondents might be primed to choose these names more often than if no such list was presented. As the list began with and consisted predominantly of family members, support from kin ties might be overestimated in the study. Moreover, as we did not restrict the number of supportive alters to five, the number of support ties could expand with each new question (respondents could mark all names in a potentially growing list, and add up to five new names, if they wished to), and the respondents might have reported more supportive ties than they would have done otherwise.

Given the novelty of the FPN data, we are as yet unable to assess how much these data differ from other social network data in terms of network composition (e.g., kin versus non-kin support networks). We were, however, able to determine whether the number of named alters differs from five proposed in the GGS 2015 questionnaire. We analysed the numbers of network

members named for each of support question. Table 7.1 shows the descriptive results for the number of alters named for different types of support (emotional, care for children, practical support in the household and financial support) and the direction of support (received or given).

Table 7.1. Descriptive statistics of the number of alters named for different forms of support

Form of support	Range	Mean	SD	Mode	Median
Emotional support received	0-15	3.1	2.2	1	3
Emotional support given	0-16	3.7	3.1	1	3
Care for children received	0-9	2.4	1.6	2	2
Care for children given	0-7	1.4	1.0	1	1
Practical help in household received	0-6	1.7	1.3	1	1
Practical help in household given	0-9	2.1	2.1	1	1
Financial support received	0-6	1.7	1.3	1	1
Financial support given	0-4	1.5	0.9	1	1

The results show that for all but one form of support (i.e. financial support given) the number of support providers or receivers exceeded the five that were imposed in the GGS 2015 questionnaire. However, the deviation from the GGS 2015 rule was rather modest, as indicated by means, modes and medians for each type of support. The largest deviation was for emotional support (both offered and received), where the ranges were the widest. Nevertheless, the mean values for these types of support are again below 5. The numbers of supportive ties is well above 5 for only a limited number of respondents

7.3 Constructed variables

The following variables were constructed:

Fieldwork

The variable METHOD indicates whether the respondent participated in the Web or CAPI mode of data collection. For details, see section 6.3.

Weights

The variable WEIGHT was constructed to correct for the overrepresentation of particular groups in the pool of respondents. For details see section 6.8.

Occupations

Information on the current or previous economic activity of respondents, their partners and parents was collected by open questions. Job titles were recoded into ISCO-88 classification of occupations. ISCO-88 classification was selected because it is the preferred GGS coding scheme, which facilitates comparison to the Polish GGS. ISCO-codes were computed for the occupation of father and mother when the respondent was 15 years old (i.e. variables ae503_isco and ae505_isco, respectively), respondent's previous or current occupation (variables ah806_isco and ah812_isco, respectively), and partner's occupation (variable ai903_isco). Not all occupations could be coded and these were assigned the value -2. There were also a number of occupations that were described in terms of manual or production work. As it was impossible to assign specific codes, those occupations were assigned value -3 (manual worker). In total approximately 5 percent of all occupations were assigned code -2 (not defined) and 5,5 percent were given the code -3 (manual worker).

Education

In the questionnaire, educational credentials followed the Polish educational system, based on the assumption that the majority of the respondents had completed their education in Poland. Dutch equivalents were included for reference. The Polish educational system has changed over the past years and to facilitate answering the questions on educational attainment, the questionnaire included the number of years required to obtain a particular diploma, to account for educational levels attained before and after the changes. ISCED-codes were computed for the highest educational level completed with a diploma for respondents, (variable aa106_isced), partners (variable ac305_isced) and parents (variables ae504_isced and ae506_isced, respectively).

Place of residence

Questions about the place of residence in the Netherlands were not a part of the survey. Instead, this information was derived from the sample details. Address of respondents who changed their place of residence were updated via CBS, yielding correct address information for all sample members participating in the survey. Three variables indicate the place of residence of each respondent: PROVINCE, MUNICIPALITY_CODE and POSTAL_CODE. The Dutch postal code is a combination of 4 digits and two letters. 4-digit postal code gives information on the city, village or a neighbourhood where a person lives. The two letters are more specific and give information on the part of the street where s/he lives. Due to the privacy considerations,

the postal code included in the dataset is limited to the 4-digit code (no letters), which makes it impossible to decipher the exact addresses of respondents, but nevertheless allows determining the approximate location of each respondent.

Language of data collection

The variable LANGUAGE_QUESTIONNAIRE is an approximation of the language used in the data collection. For details see section 6.6.

Interview duration

The variable DURATION pertains to the duration of Web interview. The duration of CAPI was not measured. For details see section 6.4.

Coding of open questions

A few questions had the option "Other, namely". All these answers were checked to ensure that written answers were not already represented in the listed question categories. If this was the case, the answer to the open question was assigned to an existing category and the original response to the open question was deleted. This procedure was carried out for answers requiring active knowledge of Polish: ab201_open (reasons for migration), ac342_xx_open (living situation of children living outside of the respondent's household, for each named child), ah815_open (how one found their job), and al1201_open (religious denomination). Answers to open question about the geographic location of network members were not recoded. We did not perform any other data manipulations.
