

Place-by-proxy: Care Infrastructures in a foundling room

Abstract¹

The concept of place has become fertile ground for sociological investigations, yet it is still undertheorized and in need of further development. Its most advanced employment is to be found within a sociological agenda on materialities of care and health architecture. In this article, we build on this work to conceptualize ‘placed care’ and to show how ecologies of care are produced and maintained through care infrastructures. The article investigates the case of an illegal baby foundling room in the Netherlands, where one may abandon one’s infant anonymously. We conceptualize this place, continuously produced through its care infrastructures, as ‘place-by-proxy’: a place that allows, by virtue of simply being there, for the animation of infrastructures around it. With this concept, we advance discussions on places as bounded and open, pointing to the work and consequences of ‘binding’ place and opening up the concept for further application to various sociological concerns, particularly in healthcare.

¹ This chapter was published in *The Sociological Review* as Ivanova D, I Wallenburg, and R Bal, 2019 Place-by-proxy: Care infrastructures in a foundling room. *The Sociological Review*, 68(1): 144-160

Introduction

I step inside. The room is small, the air stifled. When was the last time someone walked in here? I look to my left and I see a painted tree, gracefully traced along the light-blue wall. A birdhouse is perched on the tree's branches, purple and green. Under the tree I see a crib, covered with an olive-green blanket. A teddy bear guards the crib, and in its feet, I see an envelope entitled '*Lieve Mama*' (Dear Mommy). I look around and I see a black button attached to the wall and a pictogram, depicting a woman pressing this 'help' button. Stuffed animals stare at me from the chair in the corner. I turn around and I see a camera, pointed toward the crib. Uneasy, I look around – am I being observed? (Fieldnotes, December 2015)

This paper engages with debates on place, care and infrastructure, in order to understand how ecologies of care are created and maintained. We do this by using a rather exceptional example: a baby foundling room, which we see as a particularly placed care-ecology for foundlings. In this room, created by the non-governmental organization 'Beschermede Wieg'²⁴ and operated by volunteers, one may abandon their infant anonymously. Despite the lively societal debate, the room's existence has sparked, it has remained empty, with no infants abandoned there, while paradoxically igniting much action, work and discussions around it. This incongruity forced us to think differently about (and learn from) this place: as a point where various care infrastructures (Danholt and Langstrup 2012) temporarily meet. Theorizing the room alone could not explain its emptiness; its relationship to care came into focus only in relation to particular infrastructures (Star and Ruhleder 1996). Therefore, this empirical analysis explores the infrastructural making of place, arguing for an understanding of places working *by proxy* – doing work and igniting action *elsewhere*.

The concept of place has proven to be a fertile ground for sociological investigations in the last decades. While it was first developed as an analytical tool in human geography (Casey 2001, Cresswell 2004, Massey 2005) and anthropology (Ingold 2000), sociological work on place has related to discussions on gender (Ward et al. 2017), class (Paton et al. 2017), nationhood (Pilkington 2012),

²⁴ Beschermede Wieg (literally from Dutch: 'protected cradle') is a non-governmental, volunteer and donation-based Dutch organization, founded in 2014.

and memory (Degnen 2005), as well as to wider conversations on materiality (Watson 2003). The latter, in particular, have insisted on conceptualizing place as “relationally performed” (ibid. 145) and emergent from a mix of human and non-human elements (Country et al. 2016). This exploration of place as an effect of heterogeneous relationships is at the center of Buse et al.’s (2018: 253) call for attention to the “outside of care”, or how designers, planners, and architects do placemaking for care.

The relationship between place and care has been theorized as co-produced (Ivanova et al. 2016; Bowlby 2012; Milligan 2003; Milligan and Wiles 2010), with an emphasis on its emergent character and as a relational activity between humans and non-humans (Ivanova et al. 2016; Danholt and Langstrup 2012). Danholt and Langstrup (2012) have shown how care practices are located within infrastructures of care as heterogeneous assemblages. This focus on the infrastructure of care owes much to STS work showing infrastructures to be political (Bowker and Star 2000; Star 1999) and relational (Star and Ruhleder 1996) and has further benefitted from the conceptual development of place within geography. Debates on place have seen a dichotomous conceptualization of anthropological versus non-place (Augé 1995); problematized its boundedaries (Massey 1994, 2005; Malpas 2012), and seen the concept evolve from a simple location to a transient mix of “relational, material and more-than-human” (Country et al. 2016) elements.

It is against this background of place as dynamical and transient, the co-production of place and care, and infrastructures as relational, that this paper is located. Its aim is twofold: to show placed care as an infrastructural achievement, requiring ‘binding’ work, and to argue that places, as both open and bounded, may be productive through their infrastructural forms. This infrastructural productivity is what we refer to here as *place-by-proxy*. The foundling room in the Netherlands is a peculiar and fascinating case, which allows unpacking the notion of place within care practices, demonstrating this proxy work. The room seems contradictory – both a place of care and intimacy and a non-place, to be entered fleetingly. A room, carefully designed for use (for those, who would abandon an infant), which everyone hopes will never be used (and no infant will be abandoned anonymously). Much more than a place for abandonment, this room is an experiment in caring.

Concepts and method

Infrastructures are seen as “something upon which something else ‘runs’ or ‘operates’, such as railroad tracks upon which rail cars run” and are easily delegated into the background, forgotten unless they break down (Star and Ruhleder 1996: 113). They have been analyzed as deeply relational; infrastructures do not work when isolated from their use, only becoming “infrastructure in relation to practices” (ibid.). In the sociology of health and illness, the term was linked to care in an attempt to make sense of care practices in relation to space and materiality. Danholt and Langstrup (2012) use ‘care infrastructure’ to understand how an individual is always intertwined with people and things in caring. Their focus is on the mundane elements that underpin medication practices, in decentering self-care from the locus of the individual. Weiner and Will (2018) apply the term to the context of home care monitoring, arguing that care infrastructures allows them “to see the socio-technical relations behind care” (ibid.: 272). Similarly, it helps illuminate spaces that are traditionally thought of as ‘outside care’, as “designers, architects, and planners can orchestrate environments where care may take place with intended and unintended consequences” (Buse et al. 2018: 253). By relating care infrastructures to place we take this concept outside the context of mundane practices and broaden it to help us understand the making and unmaking of placed care.

Firstly, thinking in terms of care infrastructures allows rethinking the notion of place. Malpas (2012) called for clarifying the meaning of the concept after the spatial turn in sociology advanced place as relational and open (Massey 1994, 2005), which he also understood as boundless. In Massey’s view place is a “meeting point” of flows and transience – in her famous example even mountains are on the move (within a different temporality) and according to Thrift (2006) “there is no such thing as a boundary”. This “neglect of boundedness” in relational place is problematic (Malpas 2012: 238), because relations presuppose boundaries, meaning that boundedness and place must be reconsidered (ibid.: 240). We do this here in empirical terms by conceptualizing the foundling room as both deeply relational and bounded. This case allows for rethinking the boundaries of place, because it shows how place may work beyond its physical contours, through numerous infrastructures aligning.

Secondly, and related to the issue of boundedness, the room’s peculiar positioning contributes to furthering discussions on place/non-place (Augé 1995). Augé (1995) has argued that the notion of ‘place’ comes from a societal system

anchored in living on the land, “in the permanence of an intact soil”, while ‘non-place’ is characteristic of postmodernity, the contemporary world of motorways, shopping malls and airports. The foundling room project currently consists of six rooms, spread throughout the Netherlands. These rooms are identically designed and filled with the same objects; manufactured as places to go ‘through’, not stay in – in many ways they are non-place. Similarly, Augé (1995) sees non-places as fleeting containers for post-modernist movement, consumerism and disconnect, like airports and shopping malls. Yet, there are important differences, as the room is both anonymous and intimate, a last resort and – as we will show in this analysis – a place for care. We show below that, instead of a contradiction within the dichotomy of place/non-place, the room is rather a place-by-proxy, thus adding a third category to the discussion *placeness*, or how places are. Through the analysis place comes to be understood as an infrastructural alignment that is deeply relational; places that appear to be placeless, or non-places, may produce strong place effects elsewhere.

This focus on infrastructures designed the research both theoretically and methodologically, as the paper drew on ANT and relational ontology, in order to understand the configuration of place as a heterogeneous process, including both human and non-human elements. This paper is, therefore, built on the assumptions that material entities have agency (Bennett 2010) and that places are emergent assemblages (Deleuze and Guattari 1987; Delanda 2006), which stabilize briefly, while constantly changing (Massey 1994). These insights sensitized us to the dynamic nature of place, structuring the method of this study in important ways. Using an ethnographic approach, we studied the organization ‘Beschermede Wieg’ through archives, observation and participation; conducted archival research, including newspaper articles, documentaries, and Dutch laws concerning foundlings, all of which were analyzed discursively. 23 documents, including positions of the UN, The Dutch Council for Child Protection and documentation of Dutch parliamentary discussions formed the bulk of our archival research; and analyzed the website of the organization²⁵ discursively. Six in-depth, semi-structured interviews were conducted with a representative of the organization, two volunteers, a hospital physician, representatives of the Council

25 <http://www.beschermdewieg.nl>

for Child Protection, FIOM²⁶, and a Ministry of Justice official. We furthermore conducted observations in two foundling rooms and of the working process of 'Beschermede Wieg'. We observed the opening ceremony of a foundling room inside the hospital Isala hospital. We decided to focus on one of the existing six rooms and understand its place-ness. Throughout the paper we speak of 'a room', yet six of them exist in different parts of the Netherlands. These six rooms have been designed identically and there is no considerable difference between their interiors. However, the infrastructural alignment around them may vary, which is why, instead of focusing our analysis on the phenomenon in general, we explore here the room in Papendrecht, a suburb of Rotterdam. The research took place between December 2015 and June 2016. Most of the interviews were conducted in January and February of 2016, while the observations were conducted in April 2016. Follow up conversations and observations were conducted in May and June, while archival research was concentrated in, but not limited to, March 2016. The three researchers discussed emerging patterns throughout the fieldwork period, as the collected data was openly coded.

In what follows, we invite the reader to experience the room as a gathering (Latour 2004) through the alignment of infrastructures. The analysis is committed to 'staying with the trouble' (Haraway 2016) of the room and to 'troubling' the concept of place as a particularly located meaning making. The room is first explored as a place of possibility, then as an alignment of infrastructures in relation and finally as a place-by-proxy. This evolution reflects our analytical steps, as well as our story of relating to the room as an object of analysis.

26 FIOM is The Netherlands Organization Specialized in Unwanted Pregnancy and Lineage. The organization was founded in 1930 under the name Federation of Institutions for the Unmarried Mother and her Child (in Dutch: *Federatie van Instellingen voor de Ongehuwde Moeder en haar kind*). Since then, it has merged several times with other organizations, but decided to keep the acronym in the name FIOM. For more information see www.fiom.nl

Figure 1. The foundling room in Papendrecht, the Netherlands.

Enter

Entering the foundling room, one sees a black button and a pictogram, explaining what one must do to receive help. A woman holding a baby is pictured pressing the button, while the next slide shows her speaking with a volunteer. A notebook is placed on a table by the crib. Its hand-written text begs the visitor to ask for help, promising anonymity. Operating from the assumption that women who find themselves in a situation of panic after an unwanted pregnancy and birth, the room's organizers have created a story, inscribed in every object. Everything is an attempt to communicate: the painted birds and bunnies on the wall and the plush cushions say this is a place of care; the open door implies non-judgment; the button says we want to listen – all attempting to turn the visitor away from abandoning a child anonymously. This balance of anonymity and contact is a delicate one. A person who wishes to leave her baby completely anonymously in this room may do so. Yet, while the promise of anonymity is alluring, the room is, through its set-up, actively engaged in preventing it. The anonymous option is not desirable; it is “the worst-case scenario”, according to the creators.

Historically, the anonymous abandonment of infants has been addressed through the strategic employment of liminal spaces, which have existed in one form or another for centuries. In the Middle Ages in Europe it was common for

parents to leave newborns in public spaces, where they might be easily found (Boswell 1988). Infants were customarily left at the steps of a church (ibid.). Another common arrangement was the foundling wheel - a cylinder, attached to an outside wall (usually of a church) - where infants would be placed. Reaching a peak in 19th century Europe, anonymous abandonment had become a secrecy-based system, expressed in the form of the wheel, in order to preserve infant lives, while maintaining the family regime (Tapaninen 2004). A modern version of the wheel is the baby hatch. Popular in Germany, where it is called *babyklappe*, it is a place inside of a wall (usually of a hospital) with a warm bed and an alarm²⁷. In South Africa, such a hatch is called a “door of hope”²⁸. In the U.S.A. the legal abandonment of infants is legally permitted in the so-called “safe havens” (fire stations and hospitals). These brief historical notes show that, on the one hand the foundling phenomenon is characterized by a long history and diversity of forms. On the other hand, the paradox of secrecy, produced through liminal spatial arrangements, is analogous with current anonymous abandonment provisions and sensitizes to the multiplicity of foundling configurations both spatially and temporally.

Importantly, ‘Beschermede Wieg’ is the first *room*, where one can abandon an infant, as the organizers aimed to create a place, which would offer options. The room offers a narrative of different paths: when one enters it, many futures become possible; the person may reconsider, ask for help, leave some information behind or simply place the baby in the crib and never look back. A baby hatch or the steps of an orphanage are places of (legal) abandonment in many countries, but the foundling room in the Netherlands is *a place of possibilities*. It is pregnant with the potential to remake the subjects passing through its doors. According to the creator of the room, Barbara Muller²⁹, the official channels for child protection fail to offer help in every set of circumstances³⁰. The foundling room project has become controversial, because it is a place to anonymously abandon a child, while anonymous child abandonment is illegal in the Netherlands. The goal is to

prevent unsafe child abandonment of infants – something that happens rarely³¹ in the Netherlands. With 6 foundling rooms located throughout the country, a sleek-looking website, a 24/7 phone help line, a media presence and controversy on its heels, ‘the foundling room’ is more than a room; it is an assemblage of people, objects, organizations, worries and ideals.

The room seems to be, above all, a contradiction – a place (Cresswell 2004) and a non-place (Augé 1995). Much of the room is about its place-ness (the quality of *how* the room is a place; what meanings are produced within it): safety for the baby; danger for the one leaving it behind; possibilities for abandoning or not and for being anonymous or not; care for baby and woman, etc. And yet, there is a decisive lack of place-ness: untouched objects, stifled air, and emptiness; there is no ‘affective force’ (Duff 2010) within these walls. We unravel these contradictions below.

A Room of Possibilities

Sophie³² has worked with Barbara Muller before, on a project for temporary foster parents. As she serves tea in the living room, she points to her foster children – each little face framed in a picture on the shelf. Sophie is a volunteer: both as a foster parent and as a foundling room facilitator. ‘Beschermde Wieg’ operates on the basis of volunteers, who offer a part of their homes to be converted into a foundling room. The volunteers typically have some unused space, as in this case an adjoined garage, and let the organization convert it into a room. The space’s makeover is paid for and done by the organization. The volunteer’s job is to be at (or near) home at all times. The converted garage is reachable through two doors: one is an outside door, overlooking the street, and the other an inside door, through the laundry room. The inside door is always locked, while the outside door is unlocked. If the help button is pressed or a baby has been placed in the crib, Sophie’s phone will ring, and she must be there within 5-10 minutes. Sophie’s husband and son are aware of the rules and are always in contact with her. When the family is on vacation, the phone is given to the neighbor.

There is a camera, connected to Sophie’s phone, which only points toward the crib, so that whoever places a child inside would remain invisible. The police

31 Statistics are a subject of debate and are often controversial, which we will return to later. On average per year 2 babies are found alive, as recorded by NIDAA - Netherlands Institute for the Documentation of Anonymous Abandonment.

32 The name is fictitious.

are obliged to investigate anonymous abandonments, as it is punishable by law to leave a child under the age of 7 in a helpless situation (Dutch Penal Code, article 256). Five of the identically designed rooms operate from volunteers' homes, spread out throughout the country. The sixth is situated within a hospital – the first such arrangement in a public place. According to the creators of the room, this option affords an alternative. A busy hospital corridor or a quiet suburban street – the foundling room exists between darkness and light and is both visible and invisible.

Inside the room one is transformed into a liminal individual. The woman entering the room may wish to leave her baby behind, yet she may doubt this decision. She may ask for help or not, stay anonymous or not, take a puzzle piece³³ from the envelope inside the crib or not. The child, too, is unfixed. Once becoming an anonymous foundling³⁴, its life enters a liminality of a permanent character, suspended in anonymity. It may be placed with a loving family or it may struggle to find a strong connection. In a very different liminal situation, Sophie is both at home and not at home in the room. The room is in her house and she maintains it, cleans the windowsills and washes the blanket. But this is not her home anymore; it is a part of a network of identically looking places, which have been created by others with specific goals in mind.

Aligning Infrastructures

The foundling room operates in the Netherlands, where anonymous child abandonment is illegal. It is therefore a curious place, where different rules apply. One is not allowed to leave their baby in a field or on the street, but the action is (currently) tolerated³⁵ in this room. According to Dutch law, anonymous abandonment is a criminal offense (NIDAA) and in cases of abandonment an investigation follows, with the possibility of sentencing to up to 7 years in prison (Dutch Penal Code, article 257,1). Legally, one may leave a child in the care of the state, a process requiring a woman's full information. Some women may feel

33 The puzzle piece is meant to maintain a relationship with the child. One piece stays with the baby, while the one leaving it behind takes the other. This act is largely symbolic.

34 The word 'foundling' (the same as the Dutch 'vondeling') is productive, because it is loaded with the negativity and shame of being 'thrown away'.

35 From the Dutch word 'gedoogd', which may be translated as tolerated, permitted. This is a standard practice for the Dutch legislator on controversial issues (other examples included drug legalization and euthanasia). We have translated it here as tolerated, as it is neither allowed nor forbidden. The word has a strong temporal component and signifies a liminal period of tolerance. Furthermore, 'gedogen' implies a lot of work that must be done, if this state of being and doing is to be sustained. In this paper we call attention to this work, showing that it is needed, in order to keep the room's liminality.

threatened by this and abandon their child unsafely – every year up to two babies are found dead or alive in parks, containers, even shopping bags, while possibly many more die unfound (Volkskrant 2015). According to ‘Beschermd Wieg’ the room may prevent this, and the lawmakers have decided to allow, or simply not acknowledge, the room for an unspecified period of time. Proponents of the room argue for regulation, where provisions can be made, so that abandonment inside this place becomes legal. However, the Ministry of Justice is against discussing such possibilities, mainly because of the politically sensitive topic. Their strategy is to stay away from this political ‘hot potato’ as long as possible:

It is about such a small number of cases, so why should you make a new law? Just wait and see if it happens, if a baby is abandoned.

Ministry of Justice official

Numbers are important here, because they are missing. There is no statistic that everyone agrees on, because the problem of unsafe anonymous abandonment of infants is not isolated, but may be linked to other criminal practices, such as molestation, incest, human trafficking, etc. As a result, proponents of higher numbers argue, many babies are never found. In the official statistics only the babies that are found alive are registered as foundlings, while the dead infants do not enter this tally. Therefore, it becomes important who uses which numbers and to what ends. ‘Beschermd Wieg’ has put together their own statistics and publishes these on their website regularly. Their numbers include the number of women who have contacted their 24/7 helpline for advice. These, they claim, show how many women look for alternative channels:

Did you see the result of our emergency phone line? We helped already 70 women in the first year of our existence. There were 3 women who wanted to leave their baby in the room, but we changed their minds. (Emma Nieuwstad³⁶, Beschermd Wieg)

The foundling room expands here and changes; it is not about a wooden crib and stifling air, but about electrical signals, transmitted into radio waves. And these electrical signals are standing guard in front of the foundling room’s door; on the

³⁶ The name is fictitious.

phone Emma will try to convince the caller not to use the room (by explaining the alternatives), but to make arrangements, with the help of ‘Beschermede Wieg’ to go through an official channel.

The room is understood differently in the Ministry of Justice: a thick plastic folder with metal rings, which holds clippings from newspapers and documents about the activities of ‘Beschermede Wieg’. The issue of legislation is very sensitive politically, because although the advisory governmental and supra-governmental organizations (The Netherlands Council of the Rights of the Child; the United Nations Convention on the Rights of the Child; FIOM; International Reference Center for the rights of the children deprived of their family; UNICEF) are against the room’s existence, the public and the media favor a place, which would afford the possibility of saving infants from assured death:

There is a lot of political and social pressure. The position that we are taking is a difficult one, because in the debate about this issue it is always – if you are against the room, you like to have dead babies. And this is not such a white/black difference; so that makes it very hard to loudly speak against the foundling room. (Ministry of Justice official)

A change of law seems unlikely, especially in the context of Dutch socio-political culture, where controversial practices are often left unlegislated until time sways public opinion one way or the other (Kater 2002). However, when an infant is found dead and the media explodes with images of dark park alleys or, on one occasion a trash container (NRC 2014), the political conversation gathers speed and proponents and opponents of the room put various arguments forward. The Ministry of Justice must be prepared for such times, when Parliament might request the minister to speak on this issue. An official has been tasked with following the unfolding controversy of the room, gathering all advisory documents (the UN, the Council for Child Protection, UNICEF), clippings from newspapers and other related documents. These are carefully placed inside the plastic folder and arranged by affiliation and importance. The folder swells, as discussion about the room continues and more paper clippings find their way inside yet another plastic pocket.

Part of the legal and political controversy around the room comes from the fact that the Netherlands is a country with relatively few illegal child abandonments, in comparison to other European countries (as we have seen, however, numbers

are controversial). This may be partially explained by historically well-established abortion regulations (van Tiggelen 2016). A system of legal abandonment is well organized, with at least two organizations focusing specifically on helping women make informed decisions about unintended pregnancy. This means that the foundling room began operating within an already established field, where the organizations FIOM and SIRIZ³⁷ have decades of experience. As the cases of foundlings show, not all women take advantage of these structures and it is suspected that anonymity is a central concern for those who do not. In order to use the official provisions, a woman must disclose her personal information. All personal information of Dutch citizens is stored digitally in a central registry, to which many different governmental agencies have access. Arrangements can be made for secrecy, if social workers decide that a woman's life may be threatened, but bureaucracy cannot always keep a secret:

FIOM: When a child is born, it is registered in the system and 12 organizations receive this information. The social worker can inform these organizations in time (about this being a secret birth) but she has to talk to each of them before they act. And since there are 12, there is a chance that someone makes a mistake.

I: Is that a theoretical possibility or does it happen?

FIOM: It does, it has happened.

(Interview, FIOM)

Yet anonymity is not the only issue, where the foundling room organization has an advantage over official structures. As a privately funded organization, it is able to provide *more*. In an attempt to get in touch with women before a baby's arrival, they have a 24/7, free telephone-line, where a volunteer will take any questions, listen to someone's story and provide assistance, without requesting the caller's information. Compared to the governmentally sponsored FIOM, this structure is more accessible.

The government is cutting expenses, and more and more in the social field. FIOM had 14 offices all over the Netherlands 5 years ago. We have

37 SIRIZ is an organization, which offers prevention, support and care for unintended pregnancy. See www.siriz.nl

now one office, which is this, out of 14. We try to provide the same service as before, but with fewer resources. It is difficult. (FIOM official)

‘Beschermede Wieg’ is able to afford a free line, where most calls come late at night, while the other organizations are reachable only during office hours. For the foundling room organization, a success story is when the room is *not used*, and the woman in question has made contact with them by phone. In this way their success is made invisible, as essentially not using the room is their goal. The Ministry of Justice hopes for the same, because if the room is frequently used a new law would have to be introduced and much political work would have to be done, on a very emotional and complex subject. For the moment, the foundling room is a folder for the Ministry and a telephone line for the NGO.

This begs the question – how to think of the room? We argue that the room is animated through the alignment of numerous infrastructures around it. The infrastructures of Dutch law, international law and different advisory bodies; the political infrastructure of Parliament and political process; the socio-cultural infrastructure of condoning controversial practices; the infrastructure of media and public opinion; the infrastructure of transmitter and received signals of a free telephone line; the infrastructure of established official channels of child abandonment; the governmental and political practices of ‘cutting expenses’, etc. These infrastructures are only exposed if the room works in the intended way – the Ministry of Justice waits for the moment they cannot avoid the issue anymore and babies are placed in the crib; political and legal machines will only move forward once there is a necessity to do so. Before this happens, these infrastructures are invisible. Much like the camera’s view of the crib, they are not illuminated, yet when exposed, they align in a care infrastructure for the foundling.

Place in relation

Emma is busiest answering calls at night. That is when most women find the time or the courage to call. When asked whether it gets too much, she shrugs and says that she has helped many callers, implying that it is worth it. ‘Beschermede Wieg’ does not measure success by the number of babies abandoned anonymously in their foundling rooms. Instead, they focus on the number of phone calls they receive and the number of women they help in finding alternatives to anonymous abandonment. These statistics are presented on their website, where they are

linked to a necessity for a foundling room in the Netherlands and a change in the law regarding anonymous abandonment inside the room. ‘Beschermde Wieg’ is more concerned with the statistics, because their desire is to prevent babies from anonymous abandonment:

Volunteer: (...) all the times when they wanted to leave a baby, we talked them out of it, or made arrangements.

Interviewer: Which is the goal?

Volunteer: Yes, exactly, it is the goal.’

(Interview, Volunteer)

The room acts as an object of attraction, drawing those who are considering anonymous abandonment or who see no alternatives in their situation. The website and help line that promise the option of being completely anonymous is enticing. Once on the phone, the volunteers can establish trust (again with the promise for anonymity) and inform the caller of possible alternatives or give practical advice. The line essentially prevents the placement of babies and perpetuates the status of the room as experimental. It is beautifully photographed and placed on the organization’s website, where it generates interest, spreads awareness and embodies values, such as safety, happy childhood, and care. The room is very easily accessible, yet it seems to be out of reach, pointing out again that the premise of the room’s use (in its physical sense) is odd. If one wanted to abandon an infant, would they really travel for hours with a newborn to reach a quiet suburban street in a small town? The room’s use in its infrastructural sense, however, is what allows action to happen. The base of the room’s existence is liminal (as any experiment is), yet judgment is suspended indefinitely, as the conditions for coming to ‘closure’ are not set. Importantly, this suspension is not a natural occurrence, but a result of work being done, and efforts put in. The paradox of the place – constructing a room, while hoping that it would never be employed for its purpose, then becoming the actual purpose of it – reveals the ontological uncertainty inherent to the place. Is it a nursery or a crime scene?

Legally, the room is in a curious position – it has not been acknowledged by the legislator as either a legal channel for abandonment or an illegal enterprise. However, anonymous abandonment is illegal and prosecutable, making the room an accessory to a crime. The strategy pursued by the volunteer on the phone and the Ministry official serves very different purposes, yet they converge to sustain

the room's positioning. 'Beschermede Wieg' has a set of goals – to change the law for foundlings; to save the life of babies; to receive public support; to attract donations, etc. These come together in an attempt to keep the room's special status. The same is true of the other actors – the Ministry of Justice official wants to gather information in a folder and prepare for a political situation, involving the room. The goals of both the organization and the Ministry are not aligned. In fact, these are goals *in relation* to their own contexts; the red plastic folder is a political tool, while creating or volunteering at a foundling room may be a very personal goal. If we examine the result of these two infrastructures working toward their goals, we see that they converge, producing the special status of the room. Crucially, this production requires different forms of labor: the telephone line must be maintained, someone must always answer the phone, flyers and an interview must raise awareness, numbers of foundlings must be carefully calculated, information about the room must be gathered and arranged, memos must be written to the minister, etc. These forms of labor – of both human and non-human entities – center the foundling room as a particularly placed care arrangement; they do the work of connecting, similar to what McLeod (2014) has called 'collaborative connective labor'. Numerous other infrastructures are involved – the police, the Public Prosecutor's Office, the UN, UNICEF, the Netherlands Council for Child Protection, various Dutch political parties, newspapers, this article (!). These care infrastructures work in relation to one another, maintaining and prolonging the foundling room's current unclear status.

The unfixed character of the room brings up a puzzling question about place. We show here that the room is a place, which works by igniting action to happen elsewhere (by proxy). Yet, is it a place or a simple location? As theorists on place have argued, looking at places as locations only, might miss the experiential aspect of 'being' in a place (Ingold 2000), but similarly, a focus on perceiving the environment of place might miss the infrastructural work that goes into making places. This is especially true of a place like the foundling room, which is designed as generic, for a specific goal only. Such places lack true connections and are transient, non-places (Augé 1995). Yet non-places are usually burdened with speed and movement; "fleeting, the temporary and ephemeral" (ibid.), while the foundling room is static, dusty, stifled. It is pregnant with meaning(s), which are not contained in its physical contours, but within its relationalities – its infrastructures. Far from a non-place, the room is *place-full*, but this 'place-ness' (the quality of *how* the room is a place) can only be seen in the infrastructural

achievement it is produced by and contingent on. The place-ness of the room is in the way its infrastructures come together – requiring (alignment) work and caring.

Place-by-proxy

In May 2016 the news that the first ever baby has been left in a foundling room in Groningen, flooded Dutch media (NRC 2016). Reports say that the prospective mother used the phone line to contact ‘Beschermd Wieg’ and spoke with a volunteer, who helped arrange safe labor in a professional setting. The baby was then entrusted to the foundation’s volunteers, who brought it to a hospital. ‘Beschermd Wieg’ convinced the mother to leave her personal information with a notary, where the child will be able to find it, once he or she turns 16 years.

This twist in the foundling room’s story – an abandoned baby, just as many, ourselves included, had come to think of the room as an empty place – points to a fascinating manifestation of what we call ‘place-by-proxy’. Not only does the room do much work upon other infrastructures by virtue of it being an experiment, but it also has, in a very practical sense, become a proxy for this baby’s story, which media announced was ‘abandoned in the foundling room’. In fact, the baby did not come close to *being* in the room; the crib is still just as empty as it was before this occurrence. The mother phoned the organization in advance of labor and was given assistance during delivery and with surrendering the infant. The infrastructures around the room – the help line and the volunteers – worked in preventing a child from entering the room. A place-by-proxy is a place, where nothing happens, yet it propels action elsewhere, in the place’s infrastructures. The foundling room is a place-by-proxy, because it remains untouched, while its infrastructures are acted upon to perform certain practices: picking up a phone, arranging a midwife, linking up to the official channel institutions and a notary, informing the police, etc. It is telling, however, that after all these things were done, the story in every news outlet talked about the first baby “abandoned” in the foundling room. The room is the propeller and the performer, despite it staying empty. Without it, there would be no action elsewhere.

We understand the room to have been used in its physical sense, where use is a localized interaction within this particular place. Yet, using the room could also be understood in a wider sense, as in using the room’s infrastructures fruitfully (a baby has been saved). The latter definition is how a place-by-proxy operates. ‘Use’ is more than a localized place interaction, yet it is not completely

metaphorical, because it comprises a clearly defined set of practices within the proxy's infrastructures. As a physical place, the room contains a script: a scared, confused, often poor³⁸ woman who moves through the night to leave her baby. The room as care infrastructure works differently, as it is connected to actors, who want to *prevent* using the room as physical place. A place-by-proxy is a figurehead for infrastructural achievement; its *being* moves infrastructures (NGOs, governmental organizations, legal frameworks, police investigations, political parties, phone lines, hospitals, media, etc.) to enact certain practices and by doing so to come together. Therefore, a place-by-proxy not only operates through its infrastructures, but its place-ness – the quality of being a place – *is* its infrastructures.

Exit

Although not intended as such, the room has become an experiment not only in anonymous abandonment, but also in centering and decentering place: how care infrastructures come together, with very specific consequences. As an example of placed care, or the idea that care is always an ecology, co-produced in/with place (Ivanova et al. 2016), this case demonstrated how to understand place as an infrastructural achievement and in doing so, coined the term place-by-proxy.

Place-by-proxy challenges the idea of places as a priori centered and allows us to see the work required to make/bind place. Buse et al. (2018) called for exploring spaces “outside of care”, by which they mean designers, architects, and planners, who are involved in making care (spaces). Place-by-proxy problematizes the very idea of an “outside of care”. As the room demonstrates, places require work in binding through infrastructures joining together or falling apart. These infrastructures are heterogeneous: they entail legal, care and architectural work simultaneously, connecting human and non-human elements in producing places in relation. The critique on relational geography's inability to reconcile relationality and boundedness (Malpas 2012) called for alternative ways of conceptualizing place. Massey's (2005) argument that places are open and on the move is reflected in the peculiar temporality of the foundling room – this is a place that may, at any moment, fall apart. Yet, how are we to think of its

38 In interviews it became clear that there was an assumption about the identity and social status of those, leaving their baby behind anonymously: a woman, who has given birth very recently, probably a Muslim woman, scared to go to the authorities. The reason for this assumption is the practice of honor killings among some (second generation) immigrant groups in Dutch society. However, this assumption is not reflected in actual practices and there is no evidence for it.

boundedness? What place-by-proxy does, conceptually, is to problematize the issue of boundaries. Boundaries (and thus places) never exist a priori – they are made, accomplished through work, and the temporary effect of infrastructures coming together. The debate about boundedness, this case shows should consider the *how* of boundedness – how do places work (or not) and what are the effects of (non) -boundedness. What makes the room a place (the event-ing of it, as Massey would say) is predicated on its other, infrastructural doings: it happens elsewhere. Whether anonymous abandonment in the room is legal depends on the make-up of the room in a suburb's garage, the poster on the wall, the telephone line, the folder at the Ministry of Justice, the political landscape, i.e. all of the infrastructures that do care work, in order for this room to exist.

Place can easily become assumed, rather than interrogated in sociological analyses and often be seen as location (where does action happen?) or imaginaries (the politics of place, sense of place). The analysis of the foundling room allows for further conceptualizing place, particularly *of/in* (health) -care. The need for conceptualizing places for care has been attested to (Oldenhof et al. 2015) and steps have already been taken toward an ecological argument for care as inextricably placed (Ivanova et al. 2016). Work on care infrastructures has decentered self-care from the locus of individual practices (Danhold and Langstrup 2012) by including heterogenous elements in a more holistic approach to illness management. Buse et al.'s (2018) call for attention to spaces “outside of care” sensitizes to the need of exploring placemaking's infrastructural forms. This paper represents an analytical move of linking these developments in the sociology of health with geography and STS debates on relationality and infrastructures. We show that centering (whether it be self-care or a foundling room) is an infrastructural achievement, requiring work, and that attention must be paid to the processes of (de) -centering places of care. An obvious “outside of care” should not be assumed, but rather interrogated, just as place as assembled, relational, heterogenous and emergent should be understood as forms of labor, made to connect. Much more than located spatiality and if seen as a decentered heterogeneous achievement, place can help us trace connections outside of particular locations.
