# Contents

Foreword

## 1. Introduction

1.1. Main subjects of this book
1.2. Problems dealt with by various groups of authors
1.3. Work on related problems
1.4. Differences in material used
1.5. A remark on methods used
1.6. Differences in conclusions

## 2. Trends in income distribution in some Western countries

2.1. Purpose of survey
2.2. Some concepts used
2.3. Sources and errors; indicators of inequality
2.4. Incomes of income recipients, households or families, before taxes
2.5. Influence of taxes and of complete redistribution
2.6. Size of households and families
2.7. Income ratios for persons in upper and lower strata
2.8. Summary

## 3. Some examples of ‘price equations’

3.1. Theory and terminology used
3.2. A cross-section test with national figures
3.3. Two time series tests
3.4. Cross-section studies for parts of countries
3.4.1. Introduction
3.4.2. Using Chiswick’s material for the United States
3.4.3. Using Chiswick’s material for Canada
3.4.4. Research on the Netherlands by T.P. Schultz and by L.S. Burns – H.E. Frech III
3.4.5. Further research on the Netherlands
3.4.6. Some preliminary conclusions
3.5. Cross-section tests, parts of countries, continued
3.6. An incomplete absolute price equation
4. Supply factors and utility or welfare 57

4.1. Utility function as the source of supply 57
4.2. Specification of utility function 58
4.3. Two methods of measuring welfare 61
4.4. A test based on material for the Netherlands, 1962 62
4.5. A test based on material for Illinois 68
4.6. Test results for some other American states 72
4.7. Appendix on estimation of figures of Table 4.1 75

5. Demand factors and the production function 79

5.1. Production function as a source of demand 79
5.2. Two alternative Cobb–Douglas production functions 81
5.3. Two types of substitution elasticity of demand 84
5.4. Short-term elasticities of substitution 86
5.5. Long-term elasticities of substitution 88
5.6. Statistical estimation of the elasticity of substitution between graduate and other labour: introductory remarks 90
5.7. Alternative results from Bowles' (cross-nation) and Dougherty's (cross-state) material 93

6. The race between technological development and education 97

6.1. Does growth automatically reduce income inequality? 97
6.2. Long-term characteristics of demand for university graduates 98
6.3. Long-term characteristics of supply of university graduates 102
6.4. Impact of the race between technology and education on income inequality 103
6.5. Irrelevance of concepts of surplus or shortage of university graduates 104

7. Actual, feasible and optimal income distribution 107

7.1. Complete models for the Netherlands, ca. 1962 107
7.2. The complete analytical model 108
7.3. Variation of numbers of persons with education levels 1, 2 and 3 112
7.4. Changes in taxes and technology 113
7.5. The complete optimization model 117
7.6. Optimality of income distribution: some more detail 122

8. Equitable income distribution 127

8.1. Difficulties around the concept of justice or equity 127
8.2. Evolution of the economist's concept of equity 129
Contents

8.3. Implications of proposed definition; equity and optimality 131
8.4. Effects of neglected factors 134

9. Income distribution policies 137

9.1. Definition, objectives 137
9.2. Survey of means used in present income distribution policies 139
9.3. Generalized inflation 142
9.4. The distribution of wealth 147
9.5. Further proposals on income distribution policies derived from the present study 148

10. Summary and conclusions 149

10.1. Main contributions of present study 149
10.2. Demand and supply method 150
10.3. Numerical results obtained 152
10.4. Changes in social structure 155
10.5. Implicit criticism of some alternative approaches 157
10.6. Further research needed 158
