

A microscopic image showing several different types of enteroviruses. The viruses are spherical and have distinct surface structures, such as icosahedral capsids. They are colored in various shades: a large red one on the left, a blue one at the top, a yellow one on the right, and a purple one at the bottom. A large, light blue, elongated structure with a complex, folded surface is also visible in the center.

Prevalence and Genetic Diversity of Human Enteroviruses in the Context of Poliovirus Eradication
